TEST PLAN

E-commerce Website Testing – SauceDemo

Project	SauceDemo E-commerce QA Portfolio
Application Under Test	https://www.saucedemo.com/
Testing Approach	Manual functional testing
Prepared By	QA Tester
Version	1.0 – Initial plan
Prepared Date	10 November 2026

Document purpose

This test plan describes the scope, approach, resources, test activities and completion criteria for the manual testing of the SauceDemo e-commerce demonstration application. It is a planning document; actual outcomes are recorded separately in the test execution records.

1. Project Overview

The project applies manual QA practices to selected user-facing functions of the SauceDemo web application. The work includes reviewing the application, preparing test cases, executing tests, recording actual results, capturing supporting evidence and documenting potential defects for investigation.

2. Test Objectives

• Verify that the login page responds appropriately to valid and invalid credential combinations.

• Check the visibility and presentation of product names, descriptions, prices and images.

• Verify product sorting by name and price.

• Check navigation between the product listing, product details and shopping cart pages.

• Verify adding products to and removing products from the shopping cart.

• Record test outcomes and report reproducible deviations from expected behaviour.

3. Scope of Testing

3.1 In Scope

Module	Planned coverage
Login	Valid login, invalid credentials, empty fields, locked-out account, password masking and Enter-key submission.
Product visibility and information	Product count, names, descriptions, prices, images and Add to Cart button visibility.
Product sorting	Default order, name ascending/descending and price low-to-high/high-to-low.
Product navigation	Opening product details, checking displayed information, returning to Products and opening the cart.
Add to Cart	Adding one or multiple products and removing a product from the cart.

3.2 Out of Scope

The following activities are not included in this initial manual testing phase: payment gateway or real-money transactions; security penetration testing; performance and load testing; compatibility testing across a broad device/browser matrix; and automated test execution. These may be considered as separate future activities if appropriate.

4. Test Approach

• Use the SauceDemo website as the application under test.

• Use the standard_user test account for normal user journeys; use other documented demonstration accounts only for the relevant test scenarios.

• Execute each prepared test case by following its recorded preconditions, steps and test data.

• Compare the observed behaviour with the expected result.

• Record the actual result and assign an execution status: Pass, Fail, Blocked, Retest or Not Run.

• Capture screenshots where they help demonstrate the test result or a suspected defect.

• Re-run a failed or uncertain scenario before treating it as a confirmed defect.

5. Test Environment and Tools

Item	Planned environment / tool
Application	SauceDemo – https://www.saucedemo.com/
Testing type	Manual testing through a web browser
Test account	standard_user (use the published demonstration credentials supplied by SauceDemo)
Test documentation	Google Sheets / Microsoft Excel and Google Docs
Evidence	Screenshots stored in the project evidence folder
Defect tracking (learning phase)	Bug report register; Jira to be introduced as a subsequent learning activity
Source control / portfolio	GitHub repository for project documentation

6. Test Data

Test data will be selected from the demonstration accounts and product information available in SauceDemo. Credentials and product names used in each test must be recorded in the relevant test case. Invalid values should be used only for the corresponding negative test scenarios.

7. Entry and Exit Criteria

7.1 Entry Criteria

• The application is accessible in the selected browser.

• The relevant test cases and test data have been prepared.

• The tester can access the application and the required demonstration account.

7.2 Exit Criteria

• All planned test cases have an execution status or are explicitly documented as not run or blocked.

• Actual results and available evidence have been recorded.

• Potential defects have been documented and their confirmation or retest status is clear.

• A test summary report has been prepared based on the final execution records.

8. Defect Management

A test case should be marked Fail when the observed result does not meet the expected result. A suspected defect should be documented with a clear title, related test case, preconditions, reproducible steps, expected result, actual result and supporting evidence. Severity and priority should be assigned only after the impact and urgency have been assessed. A Retest status alone does not confirm that a defect exists.

9. Risks and Assumptions

• The demonstration application or test account may be temporarily unavailable.

• Application behaviour may change; test results should include the date of execution and evidence where possible.

• Some observations may require repetition before a defect can be confirmed.

• The plan is limited to the modules and activities listed in the scope.

10. Deliverables

• Requirement and application overview notes.

• Test scenarios and test cases.

• Test execution records with actual results and statuses.

• Screenshots and other relevant test evidence.

• Bug report register for confirmed or potential defects, clearly distinguished.

• Test summary report.

11. Approval / Review

This is an initial portfolio test plan prepared for a learning project. It can be updated as the testing scope, environment or approach changes.

Prepared by	QA Tester
Review status	Self-reviewed / learning portfolio
